Sequence 156, Application PC/TUS0218638A

GENERAL INCORMATION:

TAPLICANT: Millennium Pharmaceuticals, Inc. et al.

TITLE OF INVENTION: NOVEL GENES, COMPOSITIONS, KITS, AND METHODS FOR

TITLE OF INVENTION: DENTIFICATION, ASSESSMENT, PREVENTION, AND THERAPY

TITLE OF INVENTION: OF CERVICAL CANCER

TITLE OF INVENTION: OF CERVICAL CANCER

TITLE OF INVENTION: OF CERVICAL CANCER

CURRENT APPLICATION NUMBER: PCT/USO2/18638A

CURRENT FILING DATE: 2001-06-13

Homo sapiens

```
Novel nucleic acid for screening compounds useful for treating proliferative and differentiative disorders such as cancer and immune disorders comprises sequences encoding ubiquitin ligases .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ligases with F-box motifs (F-box proteins) are useful for diagnosis of proliferative and differentiated related disorders by measuring EPP gene expression. Cells expressing such proteins or their fragments are useful for screening such proteins or their fragments are useful for screening compounds. The compounds are agonists or antagonists, which are useful for treating a proliferative or differentiative disorder in a mammal such as and also major opportunistic infections, immune disorders, cardiovascular diseases and inflammantory disorders. FBP protein, analogs, derivatives and their subsequences, anti-FBP antibodies are also useful in diagnosis of the disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding substrate-targeting subunits of ubiquitin

The invention relates to screening compounds useful for the treatment of proliferative or differentiative disorders comprising detecting a change in the activity of Skp2 (F-box protein). The method is useful for screening compounds for the treatment of proliferative or differentiative disorders, particularly cancer. These compounds include small molecules, or compounds or derivatives or analogues of the new ublquitin ligases. The compounds are useful for treating diseases such as cancer (e.g. breast cancer, prostate cancer or ovarian cancer, lymphoma, small cell lung carcinoma or parathyroid adenomas), major opportunistic infections, disorders, certain cardiovascular diseases or inflammatory the invention.
                                                                                                                                                                                                                                                        Cytostatic; immunomodulator; cardiant; antiinflammatory; antimicrobial; proliferative; differentiative disorder; Skp2; F-box protein; cancer; ubiquitin ligase; breast cancer; prostate cancer; ovarian cancer; small cell lung carcinoma; immune disorder; parathyroid adenoma; FBP; inflammatory disorder; lymphoma; malor opportunistic infection; certain cardiovascular disease; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Screening compounds for treating proliferative disorders, e.g. breast cancer or prostrate cancer, infections or immune disorders, comprises detecting a change in the activity of Skp2 with either p27 or Cks1 \cdot

The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytokine; cell proliferation; cell differentiation; growth factor; haematopoiesis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoietic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopath; atheroselerosis; oronary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; cell culture; druy screening; gene therapy; antilnflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vasculopic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer.

giving an insight into their probable biological activities, and hence potential therapoutic applications. The polypeptides of the invention may differentiation activities, including cytokine, cell proliferation or cell differentiation ictivities, including cytokine, cell proliferation or cell including cytokine, cell proliferation or cell including courth factor activity; haematopolesis rigulatory activity; tissue growth activity; including chemocactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be involved in noncojenesis, cancer cell proliferation or metastasis.

Thrombolytic activities; receptor or ligand activities; or may be involved in noncojenesis, cancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nuclecties of the invention are useful for preventing, treating or ameliorating medical conditions, cell.

Conditions, neam to gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., myeloid or lymphoid cell cancerial activities may be used in the tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., or burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of vital, and promoter and infections in addition to immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides screening techniques. The present sequence represents a novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           148

                                                                                                                                                  g
                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     208

The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set comparises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprising a sequence complementary to the polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence. The primer set send sequence, where the oligonucleotide which comprises a 1'-end sequence, where the oligonucleotide comprises a 1'-end sequence. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs rapesent human cDNA sequences; AMB92486 to AMH13613 to
                                                       Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; primer; detection; diagnosis; antisense therapy; gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              271
                                                                         The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to erytokine, cell proliferentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 20

The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags. (ESTS). They can be used to stimulate cell growth, to regulate haematopolesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat infinitity, to regulate haemastasis or thrombolyysis e.g. to treat infertility, to regulate haemastasis or thrombolyysis e.g. to treat stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. Parkinson's disease. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TTCGTGTTGAGTAACCTGGCGGAGGTGGAGCGTGTGCTCCTCACCTTCCTGCCCGCCAAG 151

                                                                                                                                                                                                               The invention relates to F-box protein 44.33 with cytostatic, blurcidal, immunomodulatory, antiinflammatory and haemostatic activity. The protein and encoding polymucleotide are used in diagnosis and treatment of malignant tumour. haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The polymucleotide is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            91

The sequence is predicted from Incyte clone 5565648CB1, which was isolated from a focatal liver tissue cDNA library.

Structural features establish the protein as being associated with cell growth, differentiation and death. The invention is based on novel human CGDD-1 to -21 proteins (see ABP5830-50), the coll growth, differentiation and death.

C polynucleotides encoding them (see ABP24689-709), and to the use of these for the diagnosis, treatment or prevention of cell proliferative disorders including cancer, developmental disorders, concursing and disorders autoimmune disorders, reproductive disorders of the placenta, and in the assessment of the effects of exogenous compounds on the activity and expression of proteins and nucleic acids associated with cell growth,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Azimzai Y, Au-Young JK, Batra S, Baughn MR, Becha SD, Borowsky ML; Burford N, Ding L, Elliott VS, Emerling BM, Gandhi AR, Gietzen KJ; Griffin JA, Hafalia AJA, Honchell CD, Lal PG, Lee SY, Lu DAM, Arvizu CS, Ramkumar J, Reddy R, Sanjanwala MM, Tang YT, Walia NK; Wang YE, Warren BA, Xu Y, Yang J, Yao MG, Yue H, Zebarjadian Y;

Cells expressing such proteins or their fragments are useful for screening compounds. The compounds are quonists or antagonists, which are useful for treating a proliferative or differentiative disorder in a mammal such as breast, ovarian and prostate cancer and small cell lung carcinoma and also major opportunistic infections, immune disorders, and also major opportunistic infections, immune disorders, and also and inflammatory disorders. FBP protein, analogs, derivatives and their subsequences, anti-FBP antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Page 232; 245pp; English.

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques
                                                                                                                                                                                                                                                                                                     lung carcinoma or parathyroid adenomas), major opportunistic infections, immune disorders, certain cardiovascular diseases or inflammatory disorders. This sequence represents an F-box protein (FBP) relating to the invention.
                                                                                                                                                                                                                                                                                                                                                                           GCCTGCGTGTGCCGCTTATGGAGGGAGTGTGTGCGCAGAGTATTGCGGACCCATCGGAGC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; chromosome mapping; gene mapping; gene therapy; forensic;
food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to screening compounds useful for the treatment of proliferative or differentiative disorders comprising detecting a change in the activity of Skp2 (F-box protein). The method is useful for screening compounds for the treatment of proliferative or differentiative disorders, particularly cancer. These compounds include small molecules, or compounds or derivatives or analoques of the new ubiquitin ligases. The compounds are useful for treating diseases such as cancer (e.g. breast cancer, prostate cancer or ovarian cancer, lymphoma, small cell
                                                                                                                                                                                                                                                                                                                                  20

to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genefic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AEG00010-AEG030377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the vipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   167
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   227

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is usiful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders involved in an appliance of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and cand sequences. ABGOOLO-ABG30377 represent novel human cald sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              --- CGGAGGTGGTGG 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16175) and the encoded proteins (ABL51777-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, common and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags common formulation of the common of the common and the common of the com

Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pcMVSPORT 6 vector. Library was normalized."
